Sap assign user to authorization group

Sometimes there is a need to create a custom table in SAP. The Functional team want to restrict access to this Table. Viola! - Authorization Groups You could use S_TABU_NAM, but there is chance that there are tens of custom tables in your system and maintaining them individually in Roles can get out of hand. So, it's better you club them together in logical groupings - under Authorization Groups. For example have an Authorization Group for Sensitive Finance Tables - ZFI_S Then you can use S_TABU_DIS to provision access to these tables. To assign an Authorization Group to an table: Go to Transaction Code SE54, enter the Table Name and select Assign Authorization Group Here you will find the list of all Tables which already have Authorization Groups assigned. Click on 'New Entries' and add your table and the relevant Authorization Group SearchERP SearchOracle SearchDataManagement SearchAWS SearchBusinessAnalytics SearchContentManagement SearchHRSoftware Sep 13, 2015 3:59:12 PM Does giving authorizations one by one annoy you? Have you ever thought about any easier way to finish this process? SAP Business One have Authorization Groups, which allow you to add or change the authorization by group and assign a predefined authorization set to each user based on her/his role. How to build a group Click Administration > System Initialization > Authorization > Authorization Group. Here you may click Create Group, put Name and Description and add any person you want to change into the group. How to change the authorizations of a group Click Administration > System Initialization > Authorization > General Authorizations. Here you may change the authorizations of all the subjects. There are totally three Authorizations: Full Authorization, Read-Only (show up as Various Authorizations) and No authorization. Authorization Groups allow us to secure access to various entities in the SAP landscape. The most common application of authorization groups is to secure tables but they can also be used to secure other objects like customers, vendors, accounts or materials. In fact authorization groups are represented by the authorization field BRGRU and they form part of quite a few authorization objects. However lets start our discussion with the example of table authorization groups. Table authorization groups are created through the SE54 transaction shown below. SE54 - Initial Screen To secure access to tables/views through authorization groups, we need to assign it an authorization group. We have the choice of using any of the existing authorization groups or create a new one for our table. Both these activities can be completed through the SE54 transaction as shown below. SE54 - Create Table Authorization Groups Note that the figure above shows the existing auth-groups created in the system. The entry "S_TABU_DIS" appears at top of the screen as this is the auth groups assigned to the table needs to be maintained for the S_TABU_DIS object with the correct activity (02 – change, 03 – display, etc) in the users' role to complete the process of securing table access. Another point to remember is the fact that a table without any auth group maintained for it, is considered to be linked to the &NC& auth-group. So for these tables, &NC& need to be maintained in S_TABU_DIS. SE54 - Assign Authorization Groups Now that we are done with the use of auth groups for securing table access, lets check out their use in securing other SAP applications. To better understand the subsequent use of auth groups lets start with a display of the BRGRU field (which represents them in authorization objects) in SU20. You will note that the BRGRU field has a length of 4 and has a check table TBRG. The TBRG table is the central repository of auth groups defined in the system. When creating new groups through the SE54 transaction, we are actually accessing this table filtered for S_TABU_DIS. SU20 - Definition of field BRGRU (Authorization Group) To create auth groups for use in other objects, we need to directly access the TBRG table. We can use SM30, SM31 or SE16 for creating new entries. The figure below shows this table being maintained through SM30. We create entries for the F_LFA1_BEK object which is used to secure access to vendor master records. SM30 - Creation of entries in TBRG table Now to secure vendors through the created auth groups, we need to update the vendor master (transaction FK02) as shown below with the same and maintain the same values in the F_LFA1_BEK object in the users' roles. FK02 - Change auth group for vendor Similarly auth groups can be maintained for customers as well through the XD02 transaction as shown below. In this case the TBRG entries are for the F_KNA1_BED object. XD02 - Change auth group for customer Authorization group in SAP is a client's specific key created in a master record or in the customizing settings of the Funds Management and can be specified in a certain authorization objects in Fund Management while defining authorizations. It simplifies the grounding of an authorization concept in funds management by assembling as one the authorizations meant for a master record. Authorization group agree to extended authorization protection for a particular object and are defined directly in the relevant master records or customizing settings. They occur in authorization object together with an activity. Creating an Authorization Group TOBJ is the table that contains all the authorization objects while TACT is the table that includes all the activities and TBRG is the table that contains the definitions of the entire authorization group. It also contains all authorization group and provides information about the familiarity flanked by authorization group and the authorization object. Also note that, TBRGT is the table that defines all the description of the authorization group and BRGRU a field name for an authorization group and is used to create supplementary restrictions on authorizations. On the other hand, there are fields that must be checked to authenticate user authorizations. The group is one of the two authorization fields. In authorization object, the object S_TABU_DIS in object class BC_A is used for maintaining tables. It also controls access using the standard table maintenance tool. S_TABU_DIS is an authorization object that has the DICBERCL fields which is an authorization group with maximum field length of four characters and ACTVT field used to display the table content. One can define authorization group under basic data in the master record of commitment items, fund centers and funds and also for the Fund Management account assignments in the authorization object S_TABU_DIS. In general, SAP standard tables are assigned to authorization group and at the same time these assignments can be changed. You are able to assign tables manually to an appropriate authorization group. When doing this, first start Transaction SM30 for the maintenance view V_DDAT then create an entry used for each of these tables. In V_DDAT and store the assignment of tables used to view authorization group in sap. It is also a cross-client, for that reason it can be used and viewed in all clients. When creating an authorization group, you will rely on the requirement; In other cases, for table authorization, the groups must be available in a custom table before they are used. At times, authorization group are merely created when they are assigned to the object in a standard maintenance transaction like the vendor master data, customer master data, material master data and many more. What should be noted about this creation is that if you do not make a selection, all tables that are maintained in customized transaction are assigned to authorization group. Authorization group in sap are for all intents and purposes labels that you assign to objects like tables, programs, master data and such like objects, but they permit authorization checks for right of entry to the object with the label. Netherlands (Dutch) English Français (French) Deutsch (German) Italiano (Italian) 日本語 (Japanese) 한국의 (Korean) Polski (Polish) Português (Portuguese) русский (Russian) 简体中文 (Simplified Chinese) español (Spanish) 正體中文 (Traditional Chinese) Türk (Turkish) SAP BASIS (Software Component) SAP Basis Component BC-SEC-USR-ADM (Application Component) User and Authorization Management SUSR (Package) ABAP User Administration Data Element BRGRU Short Description Authorization Group Category of Dictionary Type D Domain Type of Object Referenced No Information Domain / Name of Reference Type BRGRU Data Type CHAR Character String Length 4 Decimal Places 0 Output Length 4 Value Table TBRG Length Field Label Short 10 Authoriz. Medium 15 Authorization Long 21 Authorization Group Heading 4 AuGr The authorization group allows extended authorization protection for particular objects. The authorization groups are freely definable. The authorization groups usually occur in authorization objects together with an activity. ProcedureYou assign the authorization using authorization object F_KNA1_BED.ExamplesDependencies ProcedureYou assign the authorization using authorization object F_LFA1_BEK.ExamplesDependencies ProcedureYou assign the authorization using authorization object F_SKA1_BES.ExamplesDependencies A posting period can be made available to only a limited set of users using the authorization group.ProcedureIf only a limited set of users is to be able to post in a particular posting period, proceed as follows:Add the posting period authorization (authorization object F_BKPF_BUP) to the authorizations of the selected users. Assign an authorization group (e.g. '0001').Enter the account type '+' for the posting period variant to which the restriction is to apply. Enter the period(s) whose use is to be restricted in the first period, those which are available to all users in the second period, and the authorization group (e.g. '0001') in the last column.ExamplesA posting period can be successively restricted. If, e.g. 10 users have the posting period authorization with authorization group '0001', and 3 of these 10 users also with authorization group '0002'.If the period is only to be accessible to the 10 selected users the authorization group '0001' is entered in the posting period variant. Access can later be restricted to the remaining 3 users by entering '0002'. ProcedureYou assign the authorization with the authorization object F_KMT_MNGT.ExamplesDependencies In FI-SL the authorization group is used in the following authorization objects:G_800_GRP Report-Writer: ReportG_803J_GJB Report-Writer: Report groupG_801K_GLB Report-Writer: LibraryG_801H_GCL Report-Writer: Parallel reportG_801U_GSY Report-Writer: Standard layoutG_GB90_Validation/Substitution/Rules: RulesG_GB92_Validation/Substitution/Rules: SubstitutionG_GB93_Validation/Substitution/Rules: ValidationG_820_GPL Special Ledger - Planning: Plan parameterG_821S_GSP Special Ledger - Planning: Distribution keyG_806H_GRJ Special Ledger - RollupG_800S_GSE Special Ledger - Sets: SetG_802G_GSV Special Ledger - Sets: VariablesProcedureMaintain the table/view V_TBRG using the extended table maintenance for the authorization object in question.Perform functionExamplesIf you want to define the authorization group 'TEST' for Sets, you must proceed as follows:Choose the table/view V_TBRG maintenanceEnter G_800S_GSE as authorization objectEnter 'TEST' in the table/viewDependencies If you want to maintain authorization groups for cost centre summaries, you must use the authorization objectG_806H_GRJ Special Ledger - RollupProcedureMaintain the table/view V_TBRG, using the extended table maintenance, for the authorization object G_806H_GRJ.Perform functionExamplesIf you want to define the authorization group 'TEST' for the cost center summaries, you must proceed as follows:Choose the table/view V_TBRG maintenanceEnter G_806H_GRJ as authorization objectEnter 'TEST' in the table/viewNoteYou will find the authorization object 'G_806H_GRJ Special Ledger - Rollup' among the authorization objects in the financial accounting.
